

IN THE ABSTRACT

1 Please replace the paragraph beginning on page 19, at line 14, with the following:

5 A blade attachment for an off-road vehicle such as an ATV is provided. A mounting frame is pivotally connected at its rearward end to the ATV rearwardly of the forward end thereof. A hinge plate is pivotally mounted, about a vertical axis, to the forward end of the mounting frame and has the blade of this invention mounted thereon to enable the blade to be pivoted left, right, or positioned in a straight position. The blade is locked in its various positions by a blade position lever. A linkage is mounted
10 on the forward end of the push tube assembly which is operatively connected to the blade position lever for moving the blade position lever between its locked and unlocked positions. The blade position lever is automatically moved to its unlocked position upon the linkage engaging the underside of the ATV. A winch is operatively connected, in a
15 slip clutch fashion, to the hinge plate to enable the blade to be pivotally moved, about a vertical axis, between its various angular positions, when the blade position lever is in its unlocked position through the linkage means.
